A.	NAMESPACE DEFINITION IN VGM XML.....	46

I. Audience

This document is intended for business and technical personnel engaged in establishing an electronic connection with INTTRA for the purpose of exchanging container Verified Gross Mass transaction messages through INTTRA via INTTRA's version of VGM XML Version 0.8.

The following sections provide details regarding general conventions, message flow, message specifications, and message samples, to facilitate effective and efficient use of INTTRA's business transaction sets.

II. General Data Format Conventions

A. Character Set Support

The character set supported by INTTRA is the UNOC UN/ECE level C, as defined in ISO-8859-1 character set (Hex 0x01 to 0xFF). Certain control characters should be avoided to ensure timely processing.

The following subset of control characters may be deleted by INTTRA in the inbound message from the Customer, to allow accurate processing by INTTRA and the carriers:

- Hex 0x01 through Hex 0x1F, **excluding Hex 0x0A (line feed) and 0x0D (carriage return).**
- Hex 0x7F
- Hex 0x80 through Hex 0x9F

While presence of these characters will not cause inbound messages to fail, the message will be stripped of these characters before storing or sending to carriers.

Characters outside of the range of Hex 0x01 to 0xFF are not supported by INTTRA and should not be sent. Character entities (Ex. ') should not be used. Inbound Customer transactions containing these values will be failed. General entities (Ex. &) are acceptable by INTTRA.

B. Numeric Conventions

1. General numeric conventions for decimal values
 - Decimal must be represented using the dot ('.') e.g., 10455.12 or 45.8735
 - Group separators must not be sent. e.g., 10,455.125 is invalid

The applicable precision varies by type of numeric data and is defined for each relevant element.
2. Numeric elements representing counts must be supplied as whole numbers without group separators.

C. Email Format Conventions

INTTRA checks email addresses for format validity, using the following rules:

- Minimum length is 6 characters (Example: a@b.cd)
- Only one @ sign
- At least one dot ('.') after @ with at least one character in between
- Must have at least 2 characters after the last dot
- Allowed characters:
 - INTTRA supports
 - ASCII characters, hash sign "#", apostrophe "",
 - Digits
 - _, -, @, .
- Disallowed characters:
 - All others not mentioned including , ; “ ‘ / \, etc.

D. Date Format Conventions

1. INTTRA's implementation includes date fields of data type <xs:datetime>. Date and Time are represented in 'YYYY-MM-DDThh:mm:ss' format.
2. The time component is assumed to be in 24 hour format. Seconds will not be transmitted to VGM Recipients.
3. Unless explicitly stated in the IG to be considered as GMT/UTC, date/time values are considered to be local at the point of activity.

III. Standards Code Lists, Master Data Catalogues

The following code lists are used by INTTRA to validate specific elements in the VGM XML message. These validations are strictly applied, and any coded values sent must conform to the published code lists maintained at INTTRA. Contact your INTTRA Project Manager (IPM) for the current code lists supported by INTTRA.

A. ISO Country Codes

INTTRA uses 2-character ISO Country code (ISO 3166 2A) lists to validate country codes in the message set.

B. ISO Container Codes

INTTRA supports a specific list of ISO Container codes. INTTRA stores Container codes as received on the inbound transactions.

C. Coded Parties

INTTRA recommends that parties in incoming transactions be identified by one of the following identity coding conventions.

1. INTTRA company ID; must be a valid INTTRA-assigned company ID and indicates a company registered with INTTRA.
2. Partner Alias registered by the Submitter, must resolve to a valid INTTRA-assigned company ID and indicates a company registered with INTTRA.

In outbound transactions, recipient alias will be supplied for registered parties for which the recipient has established aliases. When there is no recipient alias, the INTTRA ID will be supplied for registered parties.

When parties are provided, INTTRA recommends that submitters provide ISO Country code, State Code and Postal Code in structured fields, in addition to the full name and address, as this will further reduce ambiguity in party identification.

Any party literals provided in an inbound message will be sent to outbound recipients.

IV. Message Usage Summary

A. VGM Determination methods

The SOLAS regulations define two methods by which the shipper may obtain the verified gross mass of a packed container (SOLAS Regulations 2 Chapter VI §§ 4-6):

Method No.1: Upon the conclusion of packing and sealing a container, the shipper may weigh, or have arranged that a third party weighs, the packed container.

Method No.2: The shipper (*or, by arrangement of the shipper, a third party*), may weigh all packages and cargo items, including the mass of pallets, dunnage and other packing and securing material to be packed in the container, and add the tare mass of the container to the sum of the single masses using a certified method as described in paragraphs 5.1.2.3 and 5.1.2.3.1. Any third party that has performed some or all of the packing of the container should inform the shipper of the mass of the cargo items and packing and securing material that the party has packed into the container in order to facilitate the shipper's verification of the gross mass of the packed container under Method No.2. As required by SOLAS VI/2 and paragraph 5, the shipper should ensure that the verified gross mass of the container is provided sufficiently in advance of vessel loading. How such information is to be communicated between the shipper and any third party should be agreed between the commercial parties involved.

B. Key Validations and Business Rules

A VGM transaction is unique by the combination of Submitter, Submitter's Reference and Container Number. A VGM transaction is also unique by the INTTRA eVGM ID. Either set of unique identifiers may be used to amend, or cancel a VGM transaction.

Attempts to Submit an Original VGM that already exists will be rejected. A VGM transaction may be validated regardless of its state at INTTRA.

A VGM transaction is limited to 1 container.

Reference Numbers (Submitters Reference, Booking Number, BL Number, Shippers Reference, etc.) cannot be longer than 70 bytes. Only one occurrence of each reference type may be provided.

Submitter Party must be provided. Submitters must be registered with INTTRA and have active INTTRA Company ID's. Submitters must be enrolled for eVGM.

At least one of Shipper, Forwarder, Carrier must be provided and must be an INTTRA registered party identified by an INTTRA Assigned Company ID. Partners with Sponsor ID's or Submitters with INTTRA Company ID's may register aliases for Companies with INTTRA.

V. State Transition

		PROPOSED STATE		
		ORIGINAL	AMEND	CANCEL
EXISTING STATE	NONE	✓	✓*	✗
	ORIGINAL	✗	✓	✓
	AMENDED	✗	✓	✓
	CANCELLED	✓**	✗	Ignored

Legends used in the table above:

State Transition:

Allowed State Transition: ✓

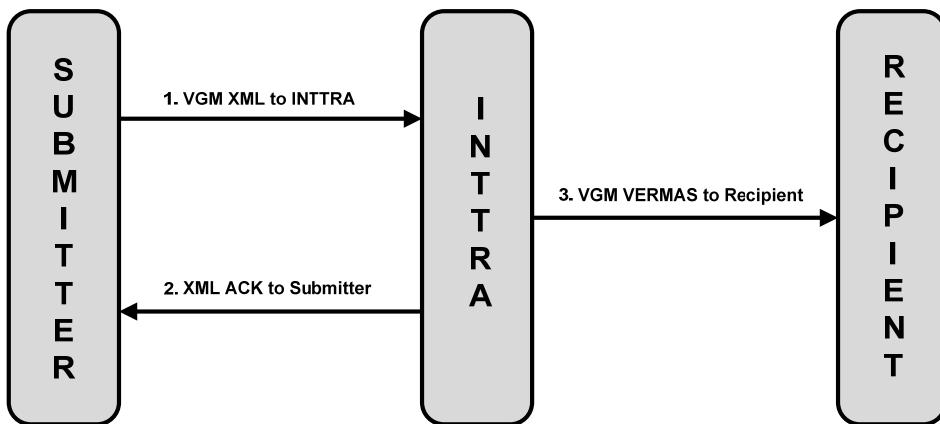

INTTRA will process Amend as Original if Original does not exist: ✓*

INTTRA will create a new VGM and issue a new eVGM ID. The existing Cancelled VGM is not reactivated ✓**

Not Allowed State Transition: ✗

Ignored State Transition: Ignored

VI. Message Flow

1. Submitter sends to INTTRA a VGM XML transaction per INTTRA Message Specification via communication methods detailed in the INTTRA Connectivity Guide.
2. INTTRA system issues a XML Acknowledgment transaction to the Submitter (if requested).
3. INTTRA's proprietary Portal Application performs message and content validation and then issues the VGM to the Recipient via INTTRA VERMAS message.

VII. VGM XML Message Revision History

A. Changes from version 0.8.1 (January 13, 2017) to version 0.8.2 (February 1, 2017)

Added NotificationContact to Submitter party.

Added the following notes to the NotificationContact “Success” and “Error” notifications will be sent to “Submitter” notification email addresses.

For all other parties only “Success” (not Error) notifications will be sent to notification email addresses.

Added “MessageRecipient” party type

B. Changes from version 0.8 (June 9, 2016) to version 0.8.1 (January 13, 2017)

Added State Transition table

Party NotificationContact added note ” Only "Success" (not Error) notifications will be sent to NotificationContact email addresses.”

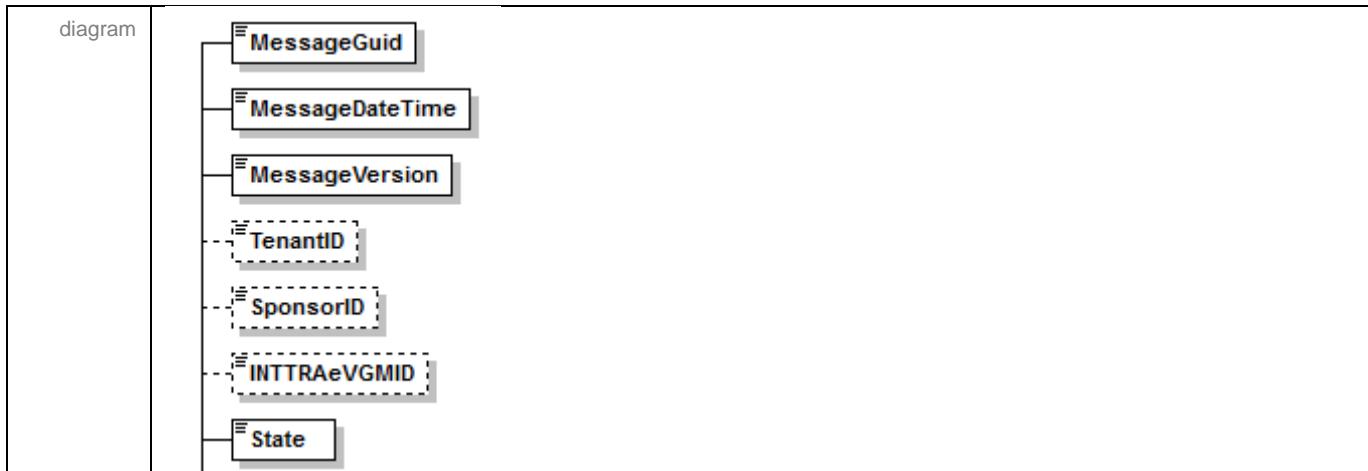

VIII. VGM XML Message Specification

element	ContainerDetails	min use	0	max use	1
---------	-------------------------	---------	---	---------	---

Element	MessageGUID									
Properties	min use	1	max use	1	min size		max size		type	string
Description	Unique Identifier for the message									
Annotation										
attributes	name	type	max size	use	enumeration			Annotations		

element	MessageDateTime									
properties	min use	1	max use	1	min size		max size		type	datetime
description	Date time when the message was created.									
Annotation	Time is assumed to be UTC/GMT. Format: YYYY-MM-DDTHH:MM:SS Example: 2017-03-31T09:30:00									
attributes	name	type	max size	use	enumeration			Annotations		

element	MessageVersion									
properties	min use	1	max use	1	min size		max size		type	string
description	Version of the Schema/IG.									
Annotation	Defaulted to 0.8									
attributes	name	type	max size	use	enumeration			Annotations		
					0.8					

element	TenantID									
properties	min use	0	max use	1	min size		max size		type	string
description	Tenant under which transaction is submitted and managed. Default Tenant is INTTRA.									
Annotation										
attributes	name	type	max size	use	enumeration			Annotations		

--	--	--	--	--	--	--	--	--	--

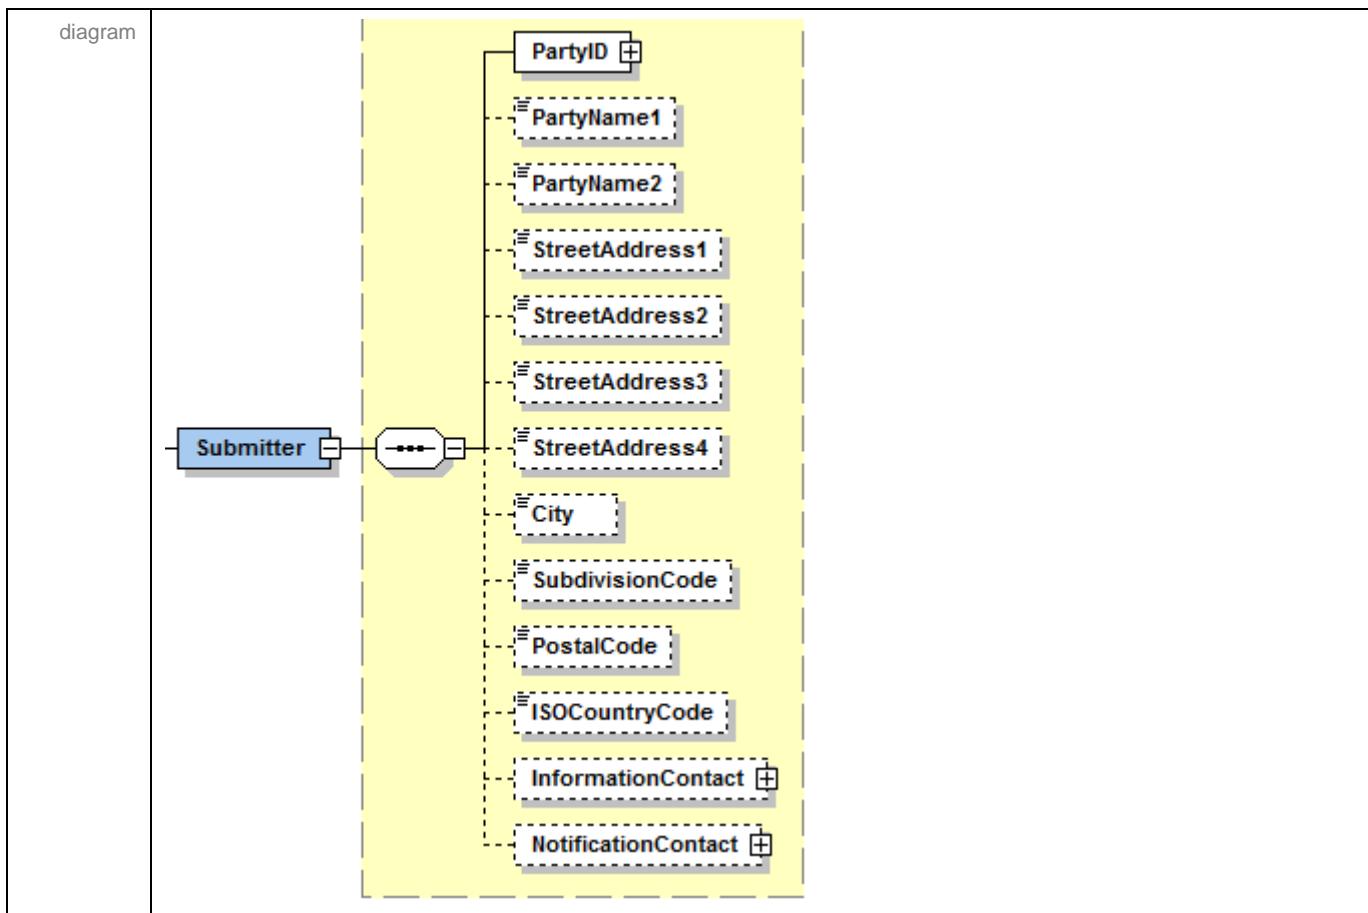

element	SponsorID									
properties	min use	0	max use	1	min size		max size		type	string
description	Sponsors are entities that have a commercial relationship with a Tenant under which they either direct transactions to the Tenant or receive transactions from the Tenant. Typically, an Alliance Partner is a Sponsor.									
Annotation	Please work with your INTTRA Integration Project Manager to determine how to populate this element.									
attributes	name type max size use				enumeration			Annotations		

element	INTTRAeVGMID									
properties	min use	0	max use	1	min size	1	max size	70	type	string
description	Unique ID assigned by INTTRA.									
Annotation	This value can be provided in an Amend or a Cancel transaction from the Submitter.									
attributes	name type max size use				enumeration			Annotations		

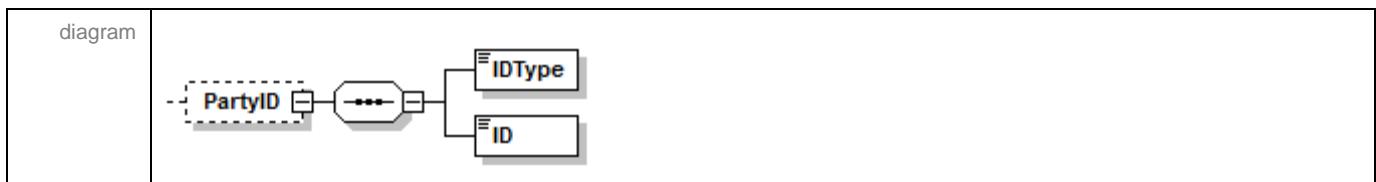

element	State									
properties	min use	1	max use	1	min size	1	max size	70	type	token
description	Indicates the status of the transaction.									
Annotation	For an Original VGM (State = Original), the combination of Submitter, Submitter Reference, and Container Number must be unique among all non-terminated (not Cancelled) VGM transactions from the Submitter. To amend (State = Amend) or Cancel (State = Cancel) a VGM transaction, the incoming VGM must match an existing VGM on either INTTRAeVGMID or the combination of Submitter, Submitter Reference and Container Number.									
attributes	Name type max size use				enumeration			Annotations		
					Original					
					Amend			Changes to previous transmission		
					Cancel			Cancel of a previous transmission

IX. Appendix 1 - VGM Use Cases

A. Use Case 1: Direct VGM Submission – Single Container

In this use case, the Responsible Party signs and submits VGM to the Carrier. Authorized Party will not be provided. A typical scenario is one in which the Beneficial Cargo Owner (BCO) is the Shipper and the BCO is providing VGM details directly to the Carrier. Variations include Forwarder or NVO acting as Shipper for their bookings with Vessel Operator Carriers. The Shipper is expected to be the Submitter. Typically, one of Shipper or Forwarder and Carrier will be provided along with the Responsible Party. Signature will be provided under the Responsible Party. The transaction may also include the VGM Determination details and the Carrier notification contact with emails for INTTRA to send the VGM via email.

```

B. Use Case 2: Delegated VGM Submission to Carrier

In this use case, the Authorized Party signs and submits VGM to the Carrier. The Responsible Party has delegated VGM signature authority to an Authorized party. Typical scenario is that a Forwarder is filing VGM for a Shipper. The Shipper is the Responsible Party and the Forwarder is the Authorized party. The Forwarder is expected to be the Submitter. This transaction may also include VGM Determination details.

  </Forwarder>
```

<BookingNumber>96580507</BookingNumber>

</n:SubmitVGM>

C. Use Case 3: 3rd Party Participant VGM Submission

In this use case, the 3rd Party submits VGM to Responsible Party or Authorized Party. Typical scenario is that a Scale is sending weights to a Shipper or a Forwarder (3PL). The Recipients will 'sign' the VGM for delivery to the Carrier. A variant has a Terminal weighing the container. The weights are VGM's, but not signed and are being routed to the party that will sign them. In this case, one of the two Methods (Method1 or Method2) will be provided. The Weighing Party will be reported. The Weigher is the Submitter. In this use case, Verification Details (Signature & Date) will not be provided. It is also likely that the Responsible Party will not be provided as the Weigher can be sending the transaction to a 3PL.

```

  <ContainerDetails>
    <ShipperOwned>false</ShipperOwned>
    <CarrierSeal>SLB2380090</CarrierSeal>
  </ContainerDetails>
</n:SubmitVGM>
```

D. Use Case 4: Hybrid VGM Submission

In this use case, 3rd Party submits VGM to the Carrier and the Responsible Party. Typical scenario is that a Terminal is weighing an incoming container. The Shipper has authorized the Terminal to sign VGMs on the Shipper's behalf. In this case, the Shipper is the Responsible Party, the Terminal is the Submitter, the Authorized party and the Weighing Party. Carrier and Shipper (BCO, NVO, Co-loading Forwarder) will be provided. Signature will be provided for the Authorized party (with Delegated flag set to 'true'). In this case, one of the two Methods (Method1 or Method2) will be provided. The Weighing Party will be reported.

</n:SubmitVGM>
```

E. Use Case 5: VGM Submission for Shipper Owned Containers

In this use case, the Responsible Party signs and submits VGM for a shipper owned container to the Carrier. By default, INTTRA assumes that containers are supplied by Carriers. In this case, the Shipper Supplied flag should be set and the ISO type should be provided. Otherwise the transaction is typical.

  </ContainerDetails>
</n:SubmitVGM>
```

</ContainerDetails>

</n:SubmitVGM>

F. Use Case 6: VGM Determination Method Provision

In this use case, the Responsible Party signs and submits VGM along with its determination method to the Carrier. It is expected that some jurisdictions will require that the method of determination be reported as part of VGM submission. This requirement would apply regardless of who submits the VGM for official consumption (Carrier, Terminal). Method reporting requires that details related to Determination Method be provided.

</ContainerDetails>
</n:SubmitVGM>
```

G. Use Case 7: VGM Determination Method and Method Authorization

In this use case, the Responsible Party signs and submits VGM to Carrier along with its determination method and also includes the method Authorization Number. It is expected that some jurisdictions will require Weighers to be authorized to use specific determination methods. Evidence of Authorization (Authorization Number) will be required as part of VGM submission. This requirement applies to the Weighing Party. For example, it seems that the UK will require Method 2 weighers to be authorized and that the Authorization Number has to be included with the Method 2 VGM submissions.

H. Use Case 8: Direct VGM Submission to Terminal

In this use case, the Responsible Party signs and submits VGM to the Terminal. Generally it is expected that Carriers will provide VGM details to Terminals, but the SOLAS regulations hold the Shipper responsible for providing VGM to Terminals and appear to allow the Shipper to do so directly. In this use case, Terminal has to be named in the VGM transaction. In order to receive VGM transactions from INTTRA, the Terminal also has to be registered with INTTRA. Otherwise the transaction is typical.

I. Use Case 9: Delegated VGM Submission to Terminal

This use case is an extension of Use Case 2 (Delegated VGM Submission to Carrier) and Use Case 8 (Direct VGM Submission to Terminal) described above. In this case the authority to sign a VGM destined for a Terminal is delegated by the Responsible Party. This use case also illustrates that the person signing the VGM does not have to be associated with any party on the transaction. Otherwise the transaction is typical submission to the Terminal.

X. XML Guidelines

A. Namespace Definition in VGM XML

VGM XML transactions submitted to INTTRA must include the namespace definition as illustrated below:

```
<n:SubmitVGM xmlns:n="http://xml.inttra.com/vgm/services/01/publication">
...
</n:SubmitVGM>
```
